
SYSTEM ARCHITECTURE (CHAT WINDOW)

1. Core Agent Framework (OpenCode)

This is the backbone of the system where all agents operate. OpenClaw will manage how agents think, act, and execute tasks.

- **What it does:**
  - Runs multiple agents simultaneously
  - Handles task execution logic
  - Allows agents to perform background operations
- **How it works:**
  - Each user action triggers an agent process
  - Agents break tasks into smaller steps and execute them
  - Supports modular structure → agents can be extended with skills (coming soon)

2. LLM Infrastructure (Self-Hosted)

All AI models are hosted internally instead of using external APIs.

- **What it does:**
  - Provides intelligence to agents
  - Handles reasoning, generation, and decision-making

- **Models Used:**

    - Claud Opus 4.6, paid version, and OpenRouter smart switching for better response
- **How it works:**
    - Requests from agents are routed to selected LLM
    - Based on task type, model selection can be optimized later
    - Internal hosting ensures:
        - Cost control
        - Data privacy
        - Faster response (if optimized)

SECURITY LAYERS

1. Multi-Layer Security System

Security is critical because agents can perform actions on behalf of users.

- **What it does:**
    - Prevents harmful or unauthorized actions
    - Ensures controlled execution of tasks
- **How it works:**
    - Every action goes through validation layers
    - Risky actions are flagged before execution

(WHAT ALL SECURITY LAYERS ARE ADDED WILL BE DISCUSSED SOON)

2. Human Intervention Loop

This is a **manual approval system** for sensitive operations.

- **What it does:**
    - Stops agents from executing critical actions without user consent
- **Sensitive Actions:**
    - Payments, purchases, sending data, pushing actions etc
- **How it works:**
    - Agent initiates action → request generated
    - User receives approval request in “Requests” section
    - Only after approval → action executes

3. Fail-Safe + Logging

Ensures traceability and rollback understanding.

- **What it does:**
    - Tracks every action taken by agent and user
    - Helps debug issues and audit behavior

- **How it works:**
    - Logs stored in structured format
    - Accessible via “Logs” section (terminal style)

CHAT SYSTEM (CORE PRODUCT)

1. Multi-Agent Chat

This is the main interface where users interact with agents.

- **What it does:**
    - Allows chatting with multiple agents in one interface
    - Agents perform tasks while conversation continues
- **How it works:**
    - Each agent runs as a parallel process
    - Chat UI streams responses while backend executes tasks

2. Usage Limits (Free Tier)

Controls system load and monetization.

- **What it does:**
    - Restricts free users to limited usage
- **How it works:**
    - Daily cap (5–10 tasks)
    - Task length restrictions applied
    - System checks limits before execution

3. Queue Management System

Handles system overload situations.

- **What it does:**
    - Prevents system crash under heavy load
- **How it works:**
    - Tasks are queued when capacity is full
    - User sees “In Queue” message
    - Tasks processed FIFO (can upgrade to priority queue later)

4. Token System

This is the core billing + usage tracking system.

- **What it does:**
    - Tracks AI usage based on input/output tokens

- **How it works:**
    - Each request consumes tokens
    - Tokens deducted in real-time
    - UI shows usage via progress bar

WEB APP INTERFACE

Overall Experience

The UI is designed to feel like premium AI tools (ChatGPT/Grok style).

- **What it does:**
    - Provides a smooth and intuitive interaction layer
- **How it works:**
    - Component-based frontend (React recommended)
    - Real-time updates (WebSockets for chat/tasks)
    - Theme switching (Dark/Light)

SIDEBAR MODULES

1. Chat

Primary working area of the platform.

- **What it does:**
    - Allows user to interact with selected agent(s)
- **How it works:**
    - Chat messages → sent to backend → processed by agent → response streamed back

1.1 New Session (+)

User can tap on this and get new session where they can give commands or do the work whatever they want to do with the agent, and just like other chat windows we can see the older sessions, or the newer sessions

Session Management

- Edit the session name, pin or delete the session (a pop appears before final deletion)
- Copy button on the provided code (code will appear in a terminal style format)
- As seen in the below image, the terminal style for coding, copy, edit, code and preview

HTML

```html
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>Creative Startup Website</title>
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <style>
    * {
      margin: 0;
      padding: 0;
      box-sizing: border-box;
      font-family: 'Segoe UI', sans-serif;
    }

    body {
      background: #0f172a;
```

Download Publish

- postcss.config.mjs
- tailwind.config.ts
- tsconfig.json

No content

(A systematic code structure, if the user wants they can view the code and edit per section)

A session is a persistent object on your server that contains:

- Full conversation history (all user messages + agent replies)
- Current codebase state (file tree, LSP symbols, git status)
- All edits/diffs that were made
- Agent's working memory (plans, todo lists, reasoning traces)
- Terminal output history

New Session

- OpenCode creates a brand-new session (you call POST /session via the API or SDK).
- Starts with a clean slate (no previous context).
- Perfect for one-off tasks.

Old / Resuming Session

- Every session gets a unique **session ID**.
- Your dashboard simply stores this ID (tied to the logged-in user in your own database).
- When the user clicks an old session:
    1. Your frontend sends the session ID to OpenCode's API.
    2. OpenCode instantly loads the **entire previous state** (history + codebase + memory).
    3. The chat window shows the full previous conversation.
    4. The agent remembers everything it did before (what files were edited, what bugs were fixed, project goals, etc.).

Sessions survive server restarts, dashboard reloads, or even days/weeks later. They are stored on disk in a local database (~/.local/share/opencode/ or inside the project folder if you want per-project storage).

2. My Agents

This is the user's personal agent management section.

- **What it does:**
    - Displays all owned agents
    - Allows customization via skills (coming soon)
- **How it works:**
    - Each agent stored as an entity with metadata
    - "Add Skills" opens modal → updates agent config (coming soon)
    - Skills enhance agent capability (APIs/tools/tasks)

3. Marketplace

Handles monetization and expansion.

A. Subscriptions

- **What it does:**
  - Controls access level (agents + tokens)
- **How it works:**
  - Plan selection updates backend entitlements
  - Limits enforced at runtime

B. Token Packs

- **What it does:**
  - Enables additional usage purchase
- **How it works:**
  - Tokens added to wallet after payment
  - Deducted per request

B. Choose Agents

- **What it does:**
  - User can choose agents based on their subscription model
- **How it works:**
  - User choose the subscription
  - Based on chosen subscription they can choose any agents from the marketplace and use it

4. Connectors (MCP) (COMING SOON)

External integrations layer.

- **What it does:**
  - Connects agents to third-party tools
- **How it works:**
  - Uses Composio APIs
  - OAuth-based authentication
  - Permissions stored per user

5. Notifications

Basic alert system.

- **What it does:**
  - Informs users about updates/events
- **How it works:**
  - Triggered by backend events
  - Stored and displayed in list format

6. Requests (Approval Engine)

Critical security UI.

- **What it does:**
  - Displays pending approval actions
- **How it works:**
  - Each sensitive action creates request entry
  - User action determines execution
  - Reject triggers confirmation step
  - Until and unless the user wont approve, the agent wont be moving forward with the task that has been assigned to it.

7. Tasks

Execution tracking dashboard.

- **What it does:**
  - Shows all agent activities
- **How it works:**
  - Each task logged with:
    - Status
    - Time
    - Result
  - Helps users monitor automation

PROFILE & SYSTEM PANEL

1. Profile

- Displays user identity (read-only initially)

2. Logs

- **What it does:**
  - Full transparency of system activity
- **How it works:**
  - Terminal-style UI
  - Stores input-output pairs

3. Live Status

- **What it does:**
  - Shows real-time system health
- **How it works:**

        - Pulls metrics like:
            - Latency
            - Server load
            - Agent responsiveness

4. Billing

- **What it does:**
    - Tracks all financial activity
- **How it works:**
    - Stores:
        - Transactions
        - Subscription details
        - Token purchases

CHAT INPUT SYSTEM

This is a **key differentiator UI component**.

- **What it does:**
    - Makes interaction flexible and powerful
- **Features & Working:**
    - File Upload → Sends file to backend parser
    - Drag & Drop → Same as upload
    - Voice Input → Converts speech to text → sent as prompt (coming soon)

TOKEN TRACKING UI

- **What it does:**
    - Shows consumption visibility
- **How it works:**
    - Progress bar linked to backend token counter
    - Updates in real-time after each request

AGENT DEPLOYMENT

- **What it does:**
    - Activates selected agent for usage
- **How it works:**
    - User selects agent → clicks deploy
    - Confirmation popup prevents accidental deployment
    - Once deployed → agent becomes active (non-reversible)

UI/UX SYSTEM

Design Philosophy

- Premium, minimal, futuristic

Behavior

- Hover animations on icons
- Smooth transitions
- Micro-interactions for feedback

Implementation

- Use:
    - Tailwind / modern UI frameworks
    - Animation libraries (Framer Motion)

FUTURE IMPROVEMENTS

- More fast servers with less latency and high value output
- Priority execution for paid users
- Smart LLM routing
- Third-party agent marketplace
- Advanced analytics dashboard

ADMIN PANEL

The important pointers and features for the Admin Panel, derived from the system architecture and requirements documentation, are focused on achieving majority control over billing, system performance, user management, and security.

Here are the key administrative controls and visibility features:

1. Billing and Monetization Controls

The Admin Panel must allow comprehensive control over pricing and revenue elements:

- **Editable Pricing and Plans**
  - Make all subscription pricing, offers, discount settings, and tokens editable.
  - Set the pricing for tokens, which needs to be editable due to inflation and new rates.
- **Fees and Charges Management**
  - Allow editing of the platform fee. (the subscription charges)
- **Tier Management**
  - Ability to change the limits for the **Free Tier** (e.g., based on tasks or tokens, suppose we are giving the free limit for testing, so there the user can choose OpenCode, which would have no tokens limits, no tasks limits, but would wait after some tasks like after 50 tasks, so it trigger the notification that you've reached you limit, limit would be reset after 2 hrs, so that the user wont use it like deadly rigorously).
- **Financial Tracking**
  - View key metrics such as the total number of subscriptions and activations.
  - Track all financial activity, including transactions, subscription details, and token purchases.
  - Allow the team to upload credits into the system for various LLMs.

2. System Monitoring and Live Status

To ensure full control and traceability, the admin panel needs real-time monitoring and robust logging:

- **Live System Health**
  - View the live status of servers, LLM models, and Agents, with a refresh rate of around 5 seconds, or real-time updates.
  - Pull metrics for live status, including latency, server load, and agent responsiveness.
- **Logging and Auditing**
  - Access the full log details to track what users are doing with the bot or system.
  - View all interaction logs, which capture user input (prompt) and Agent Output (1-line summary).

    - The log section should be non-editable and visible to both the user and the admin panel. (admin panel, as per user logs)
- **Advanced Analytics**
    - Implement an advanced analytics dashboard (noted as a future improvement).
    - Monitor all agent activities via a Tasks execution tracking dashboard, which logs the status, time, and result for each task.

3. Core System and Configuration Control

- **LLM Routing**
    - Enable and configure smart routing in OpenRouter so that the underlying language model changes according to the user's prompt. (maybe not required, as this would be handled by OpenRouter, the smart switching/routing thing)
- **Token Tracking Configuration**
    - Manage how token input and output are counted and connected to tokens usage, limits, and status.

4. User and Security Oversight

- **Security and Interventions**
    - Provide control and monitoring over the security layers and the Human Intervention Loop (Approval/Reject system).
    - Maintain control over API keys security. (if any)
- **User Visibility**
    - View user details and associated device details.

SECURITY THING

These are the security layers that we need to add, as our main aim is for security thing for the users:

- Composio (MIT) - GitHub: https://github.com/ComposioHQ/composio - Secure tool authentication and credential management for agents, preventing unauthorized actions like payments; 27k+ stars, YC-backed for production reliability.
- Langfuse (MIT) - GitHub: https://github.com/langfuse/langfuse - Observability and anomaly detection with immutable logging for LLMs/agents; 22k+ stars, YC-backed for enterprise-scale tracing.
- Opik (Apache 2.0) - GitHub: https://github.com/comet-ml/opik - Monitoring and evaluation with runtime anomaly detection; 17k+ stars, Comet-backed for scalable production oversight.
- gVisor (Apache 2.0) - GitHub: https://github.com/google/gviso r - Kernel-level sandboxing for container isolation, reducing attack surfaces; 17k+ stars, Google-backed for secure untrusted executions.
- NeMo Guardrails (Apache 2.0) - GitHub: https://github.com/NVIDIA/NeMo-Guardrails - Policy-based prompt and conversation guards to prevent harmful outputs; 5k+ stars, NVIDIA-backed for safe LLM interactions.
- PyRIT (MIT) - GitHub: https://github.com/Azure/PyRIT - Red-teaming framework for vulnerability probing in generative AI; 3.5k+ stars, Microsoft/Azure-backed for proactive risk identification.
- Llama Guard (MIT) - GitHub: https://github.com/meta-llama/llama-recipes (guard component) - Output content filtering and moderation model; part of Meta's Llama ecosystem (58k+ stars overall), for safe response generation.
- LLM Guard (Apache 2.0) - GitHub: https://github.com/protectai/llm-guard - Real-time input/output scanning for prompt injections and PII leaks; 4.5k+ stars, ProtectAI-backed for AI-specific defenses.

Human Intervention Loop

The human approval loop where the agent when perform any sensitive tasks like edit, delete, push, update, pay, purchase etc then the request would be gone to the dashboard that this agent is asking for this to approve or reject.

- LangGraph (MIT) - GitHub: https://github.com/langchain-ai/langgraph - Stateful graph-based orchestration with native human-in-the-loop interrupts for approvals; 25k+ stars, LangChain ecosystem-backed for production agent workflows.
- CrewAI (MIT) - GitHub: https://github.com/crewAIInc/crewAI - Role-based multi-agent framework with human feedback tools for task approvals; 44k+ stars, for collaborative agent pauses and resumptions.

We are open to edit, modify these security things for human loop, we just want if any agent performs any sensitive tasks, it would notify the user and send the request as approve or reject.

WORKFLOW

SCREEN 1: USER ONBOARDING FLOW

[User Lands on Website]

↓

Clicks "Get Started"

↓

[Chat Interface Opens - Unauthenticated State]

↓

System Check: Is User Logged In?

↓

NO → Show Auth Options:

→ Continue with Google

→ Login/Signup with Email

↓

User Completes Authentication

↓

Backend:

- Validate credentials
- Create/Fetch User Profile

↓

[User Redirected to Chat Dashboard]

↓

Default State:

- Free Tier Activated
- 1 Default Agent Assigned

SCREEN 2: FREE USER FLOW

[User Enters Dashboard]

↓

Top Notification:

"You are using Free Version – Upgrade to unlock more features"

↓

System Assigns:

- 1 Default Agent (Non-changeable)

↓

User Sends Task

↓

System Checks:

- Daily Task Limit (Max: 5)
- Task Complexity

↓

IF Within Limit:

→ Task Executed

↓

IF Limit Exceeded:

→ Show: "Daily task limit reached"

↓

IF Task Too Large:

→ Restrict / Ask to Upgrade

↓

Restricted Access:

- ❌ Token Section (Locked) (it would be grey, user can view but cannot select anything)
- ❌ Agent Selection (Locked) (it would be grey, user can view but cannot select anything)

(under marketplace section we have 3 options: Subscription, Tokens, Agents Selection)

SCREEN 3: SUBSCRIPTION FLOW (PAID USER)

[User Navigates → Marketplace → Subscription]

↓

Display Plans:

- Free
- ₹999 / ₹2999 / ₹9999 / Custom

↓

User Selects Plan

↓

Clicks "Subscribe"

↓

Redirect → Razorpay Payment Gateway

↓

Payment Processing

↓

IF Payment SUCCESS:

→ Razorpay Callback → Backend Verification

→ Update User Plan

→ Unlock:

- Agent Selection
- Token Section

↓

→ Show Success Popup

↓

→ Redirect to Dashboard

IF Payment FAILED:

→ Show Error Message

→ Stay on Subscription Page

(When the user is in free tier, they can see the tokens page and agents page, they can only see those pages but cannot select or perform any activity there, we want the user that they can easily see the agents what kind of agents we have, and tokens we have, so there is nothing in that, just grey and view only)

SCREEN 4: AGENT SELECTION FLOW

[User Navigates → Marketplace → Agents]

↓

System Check:

Is Subscription Active?

↓

NO:

→ Show: "Please activate subscription to choose agents"

→ Block Selection

YES:

↓

Fetch Plan Limits:

- Max Agents Allowed (Example, basic plan allows only 3 agents to choose)

↓

User Selects Agent(s)

↓

IF Within Limit:

→ Can select from the pool of agents

→ Available in Chat Dropdown

IF Exceeds Limit:

→ Show: "Agent limit exceeded as per your plan"

Then Choose Deploy agents – > a pop up appear which says a caution message which says this task cannot be reversed, please be cautious and choose the agents carefully (even in the pop up we can share the list of agents that they have chosen, like we see in the ecommerce page before checkout)

SCREEN 5: TOKEN PURCHASE FLOW

[User Navigates → Marketplace → Tokens]

↓

System Check:

Is Subscription Active?

↓

NO:

→ Lock Page

→ Show: "Upgrade to access tokens"

YES:

↓

Display Token Packs

↓

User Selects Pack

↓

Redirect → Razorpay

↓

Payment Processing

↓

IF SUCCESS:

→ Add Tokens to Wallet

→ Update Token Progress Bar

→ Show Confirmation

IF FAILED:

→ Show Error Message

SCREEN 6: CHAT & TASK EXECUTION FLOW

[User Sends Prompt in Chat]

↓

System Checks:

- Token Balance
- Task Limits

↓

IF Valid:

→ Send Task to Agent

↓

Agent Starts Processing

↓

Check Task Type:

↓

[Normal Task]

→ Execute Directly

→ Return Response

↓

[Sensitive Task]

→ Pause Execution

→ Send Request to Approval System

SCREEN 7: REQUEST APPROVAL FLOW

[Agent Triggers Sensitive Action]

↓

Create Request Entry

↓

Send to "Requests Section"

↓

User Views Request:

- Approve
- Reject

↓

IF Approve:

→ Resume Task Execution

→ Complete Task

IF Reject:

→ Show Confirmation Popup:

"Are you sure?"

↓

YES → Cancel Task

NO → Return to Pending State

SCREEN 8: TASK TRACKING FLOW

[Every Task Executed]

↓

Log Entry Created:

- Task Type
- Status (Completed / Pending / Rejected)
- Timestamp
- Agent Used

↓

Store in Database

↓

Display in "Tasks Section"

↓

User Can View:

- Task History
- Status Breakdown

SCREEN 9: NOTIFICATION FLOW

[Event Triggered]

- System Event
- Admin Action

↓

Create Notification Entry

↓

Store in Database

↓

Display in Notification Panel

↓

User Actions:

- View Notification
- Mark All as Read

SCREEN 10: CHAT MEMORY FLOW

[User Sends Chat]

↓

Store:

- Message
- Agent Used
- Timestamp

↓

Link to User ID

↓

Save in Database

↓

User Can Access Chat History Anytime

SCREEN 11: BILLING FLOW (RAZORPAY)

[User Initiates Payment]

- Subscription OR Tokens

↓

Redirect → Razorpay

↓

Payment Processing

↓

IF SUCCESS:

→ Razorpay Callback

→ Backend Verifies Payment

→ Update:

- Subscription Status OR
- Token Balance

↓

→ Store Transaction:

- Transaction ID
- Amount
- Status

IF FAILED:

→ Show Failure Message

SCREEN 12: LOGGING FLOW

[Every Interaction]

↓

Capture:

- User Input (Prompt)
- Agent Output (1-line summary)

↓

Store in Logs

↓

Display in "Logs Section"

↓

Format:

- Terminal Style View

(this log section would be non editable from any side, it would be visible to user as well as to our admin panel)

FINAL MASTER FLOW (COMPLETE SYSTEM)

User → Auth (Google / Email)

↓

Free Tier Activated

↓

User Uses Chat

↓

Upgrade → Subscription

↓

Unlock Agents + Tokens

↓

Chat → Task → Agent

↓

IF Sensitive → Approval Loop

↓

Execution → Result

↓

Store → Tasks / Logs / Memory

IMPORTANT POINTERS (if missed in the above description)

- We need to work on the things like how tokens input and output are counting, if its automatic then no issues, as we need to connect that to tokens usage, limits, token status etc
- We would be having various subscription plans namely:
  Free Tier - free tier usage, limited chats, sessions, no tokens issue, only task sessions and smaller tasks not too big task (error with explanation message would be shown if task is big) (EVEN WE WANT TO CHANGE THE LIMIT OF FREE TIER, LIKE TASKS BASED, OR TOKENS BASED), as we are planning to give it to beta testing, so we want users to use it very rigiriously so that we dont want any issue into this
  Basic - INR 999 / month, can choose 3 agents, 500,000 tokens
  Professional - INR 2999 / month, can choose 7 agents, 2 Million tokens
  Business - INR 9999 / month, unlimited agents choose, 5 Million tokens
  Enterprise - Contact sale team
  (MAKE ALL THESE PRICING, OFFERS, DISCOUNT THING, TOKENS, ETC EDITABLE IN THE ADMIN PANEL FOR OUR TEAM)
- We are working with OpenCode, connecting it with OpenRouter with Claud Opus 4.6 model and also with some other free to use models as well and also some paid models, so there we would be uploading the credits into the system, and the users will use it, we also need to enable smart routing in OpenRouter so that the model changes as per the user's prompt
- The token system needs to be robust, as we are taking a markup in the tokens, and the pricing in the tokens would also be editable in the admin dashboard as due to inflation and new rates we need to change the tokens pricings etc
- We have the code for the website, we need to host that and make some minor modification into it, and thats done
- Drag and drop files, we have to limit the file size to 25 to 30 Mb, and also the type of files also.
- *If possible, we can add voice agent that can hear and convert to text, then returns back in voice mode (if possible then only, else we can make that in Phase 2)*

PA
PineApplee Assistant Online
Your main AI assistant for general tasks and conversations.
WHAT THIS AGENT CAN DO
Natural Language Understanding
Understands and processes complex natural language queries with context awareness
Multi-turn Conversations
Maintains context across long conversations for coherent responses
Code Generation
Generates clean, efficient code in multiple programming languages
Document Analysis
Extracts insights, summaries, and key information from documents
Task Automation
Automates repetitive tasks and workflows with intelligent suggestions
Knowledge Retrieval
Accesses and retrieves relevant information from knowledge bases
CURRENT SKILLS (3)
CH
Code Helper Online
Specialized in code review, debugging, and optimization.
WHAT THIS AGENT CAN DO
Code Review & Analysis
Reviews code for bugs, security vulnerabilities, and best practices
Debugging Assistance
Identifies and helps fix errors with detailed explanations
Performance Optimization
Suggests optimizations to improve code speed and efficiency
Unit Test Generation
Automatically generates comprehensive unit tests for your code
Refactoring Suggestions
Proposes cleaner, more maintainable code structures
Documentation Generation
Creates clear documentation and code comments automatically

Task Details

This task involved analyzing 1,247 conversations across 5 agents, identifying key trends, and compiling performance metrics. The report includes response time analysis, token usage breakdown, user satisfaction scores, and recommendations for optimization. All data has been processed and formatted into a comprehensive PDF document.

Tokens Used 12,500 | Duration 2m 34s | Started Mar 22, 1:46 PM
